This program needs a little bit of information before it can run successfully. You will need to open the settings.txt file and enter:

- sessionid – This is the data from your sessionid cookie from steamcommunity.com
- steamLogin – This is the data from your steamLogin cookie from steamcommunity.com
- steamparental (optional) – This is data from your steamparental cookie from steamcommunity.com. If you're not using Family View in Steam, simply leave this blank

The program uses this data to simulate you being logged in to the steamcommunity.com website, so it can determine which games have cards available, and when the program is done idling cards for a particular game.

Enter this data on each line of the settings.txt file in the quotes provided. **These values should only need to be entered once when initially setting up the application.**
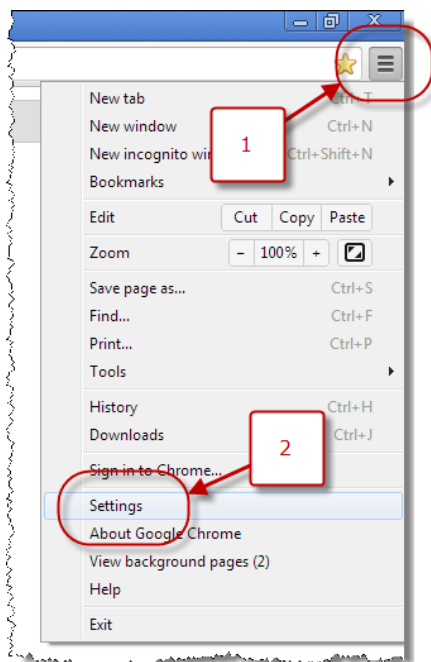

Getting Cookie Data

I'll step through how to get this data using Google Chrome. Other browsers will have similar functionality, but will have different menus or commands.
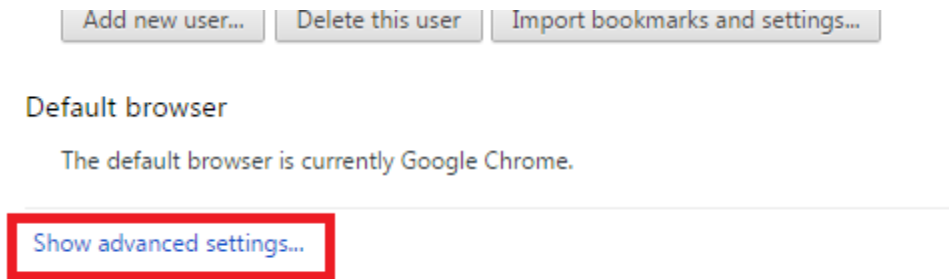

Step 1: Open Chrome

Step 2: Make sure you're signed in to the Steam Community website by visiting http://steamcommunity.com. Make sure your avatar appears at the top of the page. If not, sign in using the "Login" button.
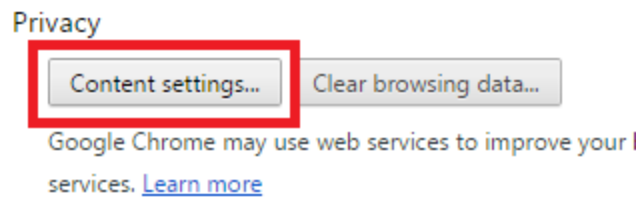

**Step 3**: Open Settings by selecting it from the menu button.

**Step 4**: Click "Show advanced settings…" at the bottom of this page

Add new user… | Delete this user | Import bookmarks and settings…

Default browser

The default browser is currently Google Chrome.

Show advanced settings…

Step 5: Under the Privacy heading, click "Content settings…"

Privacy

Content settings… | Clear browsing data…

Google Chrome may use web services to improve your l
services. Learn more

Step 6: Under the Cookies heading, click "All cookies and site data…"

Cookies

◉ Allow local data to be set (recommended)

◯ Keep local data only until you quit your browser

◯ Block sites from setting any data

☐ Block third-party cookies and site data

Manage exceptions… | All cookies and site data…

Step 7: Using the search in the upper right, enter "steamcommunity.com"

Remove all shown | steamcommunity ✖

rage
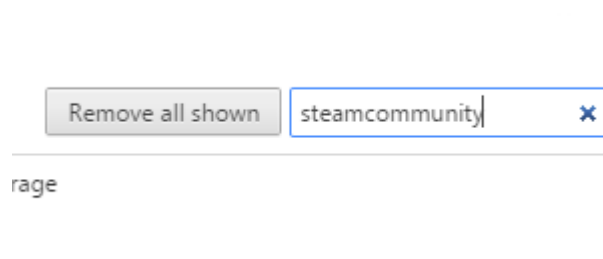

Step 8: Click on the site "steamcommunity.com" (it should be the first and possibly only search result)

Step 9: Click on the sessionid cookie
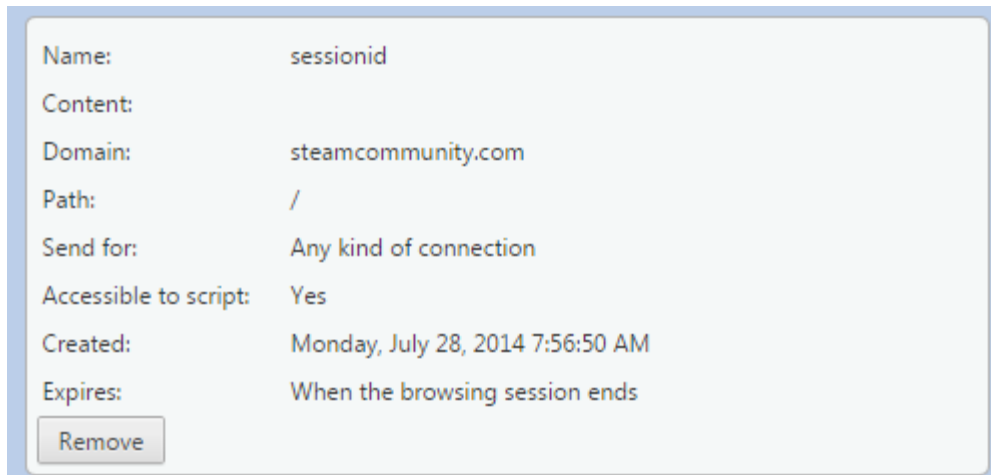

Step 10: Copy the entire value of "Content" into the settings.txt file where it says sessionid="". Put your sessionid data between the quotation marks.

Step 11: Repeat steps 9 and 10 but this time use the steamLogin cookie.

Caution

Do not share your cookie data with anyone

Is this safe?

Presumably so.

Can I play a game while this is running?

It's possible, but doing so may significantly reduce your card drop rate. For best results, exit this program before playing a game.

How do I close the application?

Simply click the red X on both the application and idling window.

How does this work?

First of all, the program will determine which of your games still have card drops remaining. It will go through each application and simulate you being "in-game" so that cards will drop. It will check periodically to see if the game you're idling has card drops remaining. When only one drop remains, it will start checking more frequently. When the game you're idling has no more cards, it'll move on to the next game. When no more cards are available, the program will exit.

Does this work if my Steam isn't in English?

Not at this time. Hopefully this will be working in a future update.

This isn't working, what do I do?

This program is currently a work in progress. If something doesn't work, just wait for a new version to be released.
